

# Editing A Web Skin

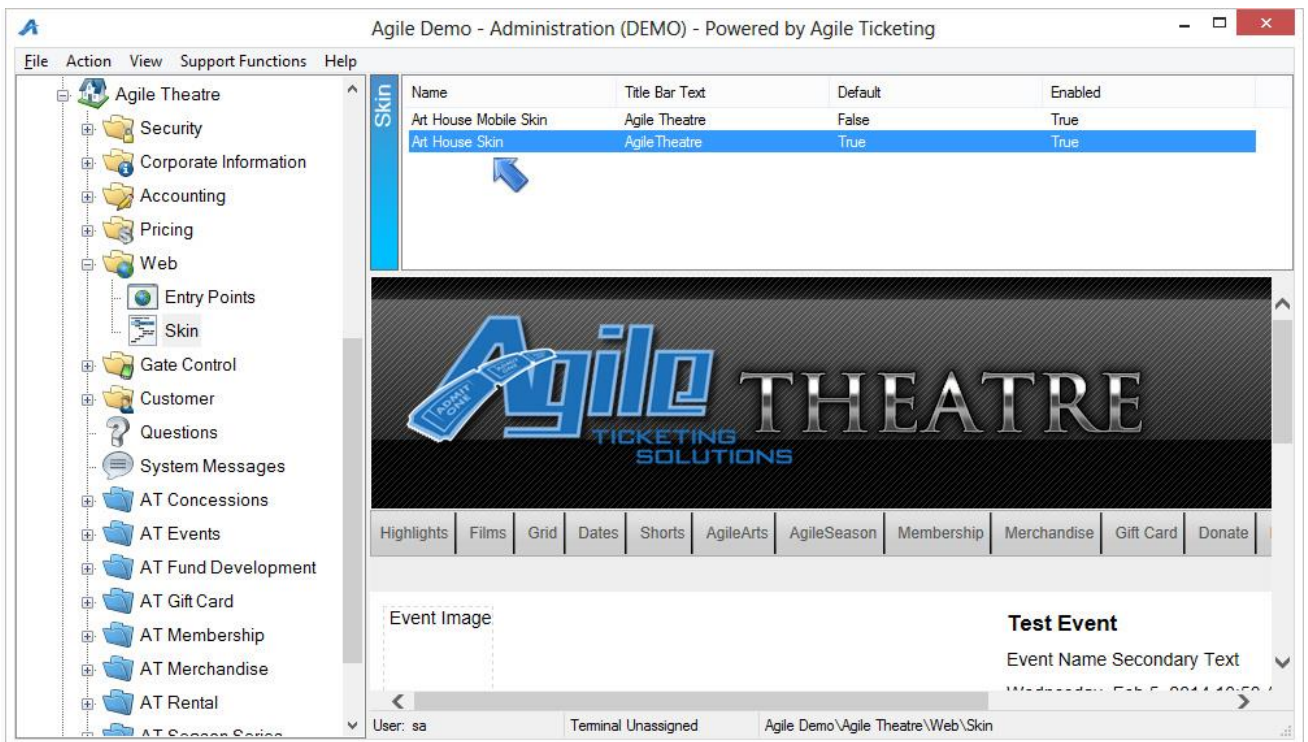

1. Start out by [logging into](#) the Agile Ticketing admin application.
2. Choose your organization from the tree in the left hand column and expand to show your organization's administration options.

3. Expand the **Web** folder and click on the **Skin** option.

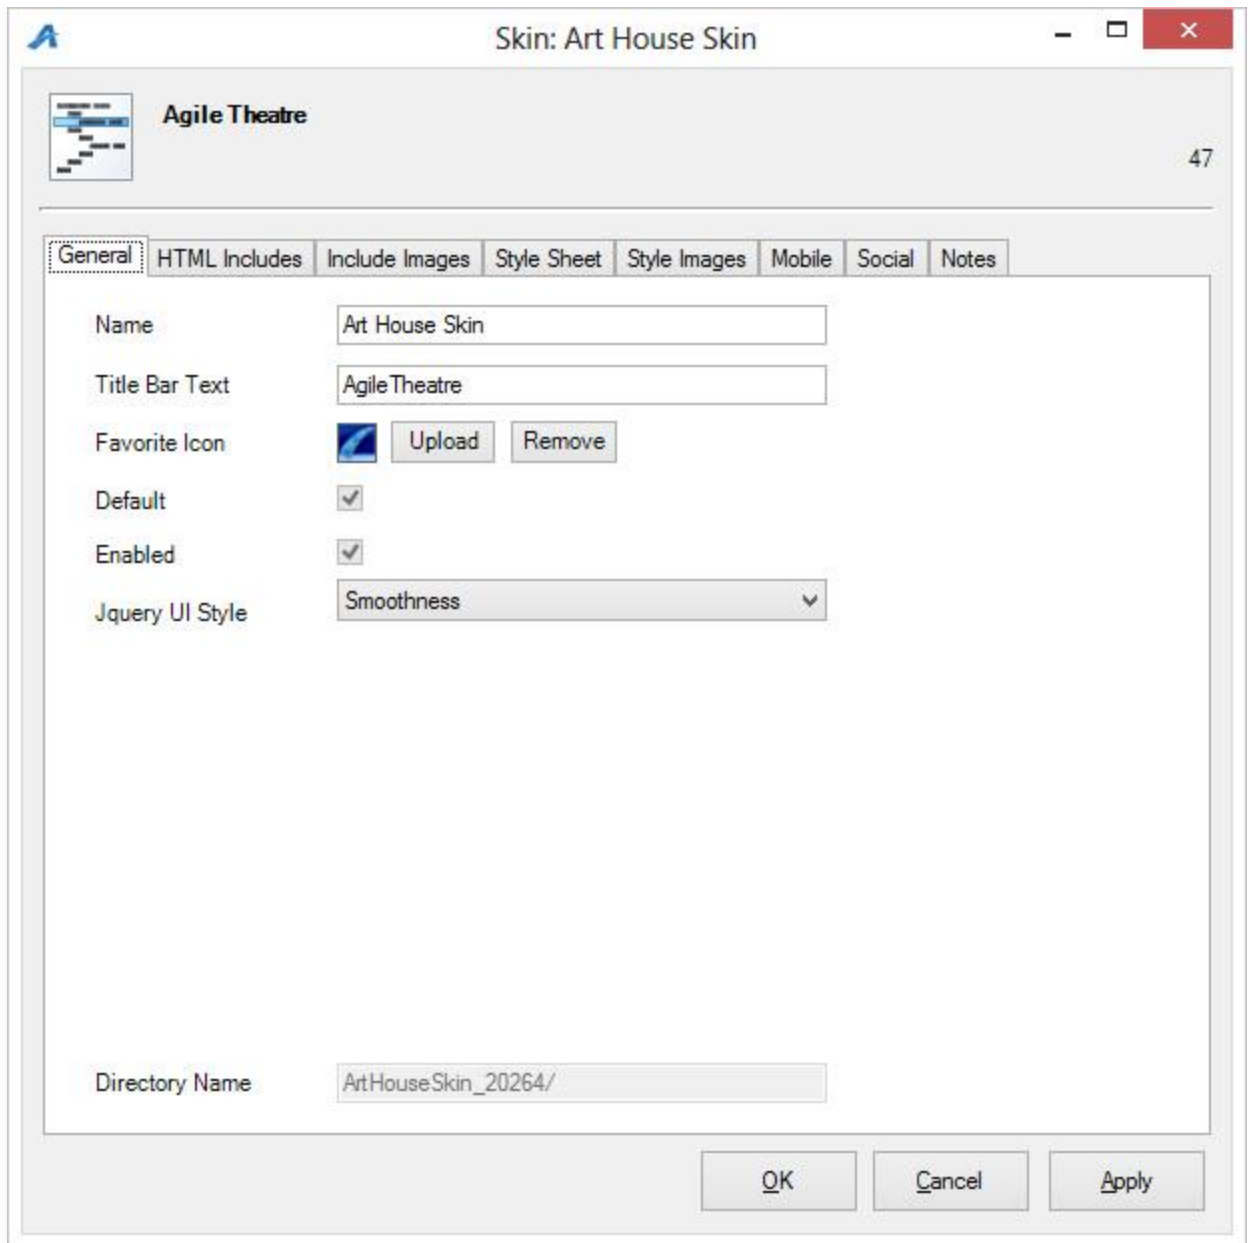

4. Double click on the **Skin** that you want to edit.

5. The **Web Skin** consists of several parts.

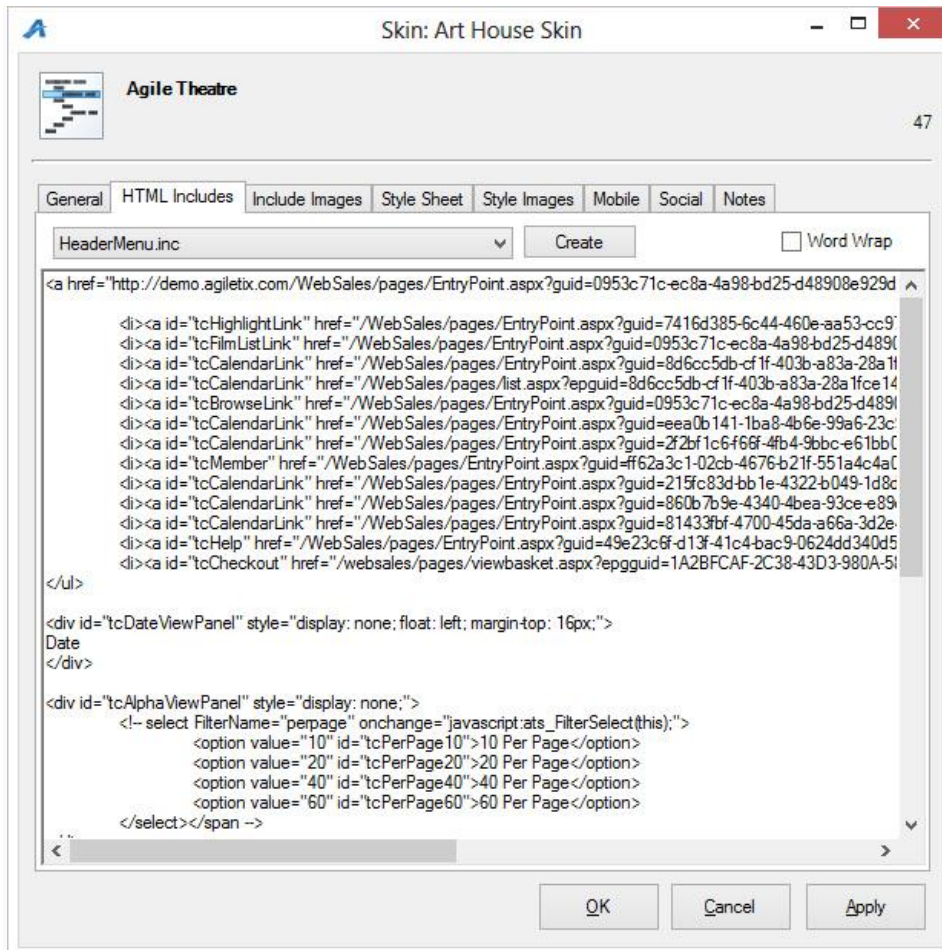

- The **Name** of the skin.
- The **Text** to show in the browser title bar.
- The **favicon** to show in the browser.
- The **Default** skin is used for API integration and AMS based order confirmations.
- The **Enable** option can be used to enable/disable the skin to be chosen for Entry Points.
- The **JQuery UI Style** is a style framework used for popup boxes and menus. See the [jQuery ThemRoller](#) for examples of each style.

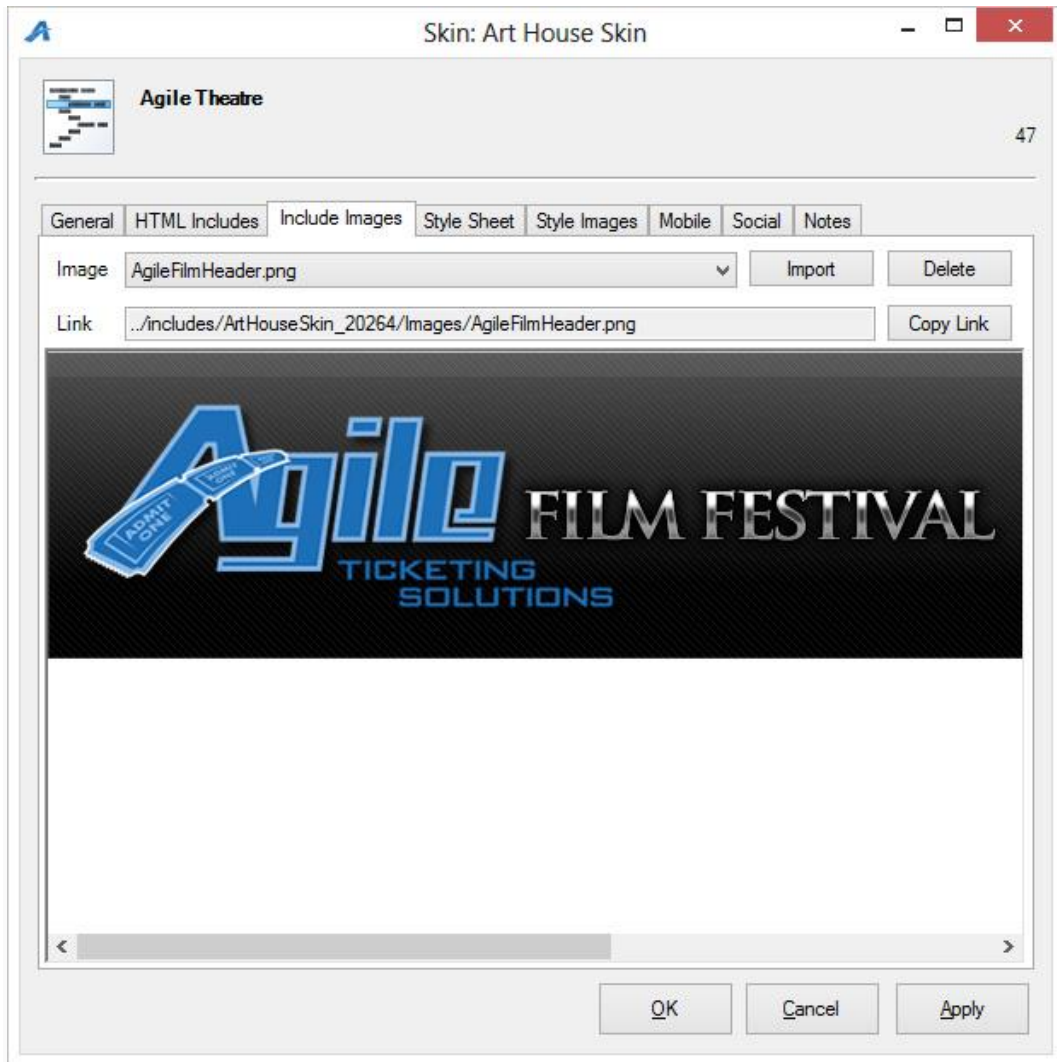

6. The **HTML Includes** tab allows you to change html and javascript web assets. Several files can be chosen from the dropdown selection box.

- **1-CustonScripts.js** - Main client javascript file used to customize skin.
- **HeaderMenu.inc** - File included at the top of all pages. Logos and main menus are defined here.
- **Footer.inc** - File included at the bottom of all pages. Contact information and 1-CustomScript.js reference are defined here.

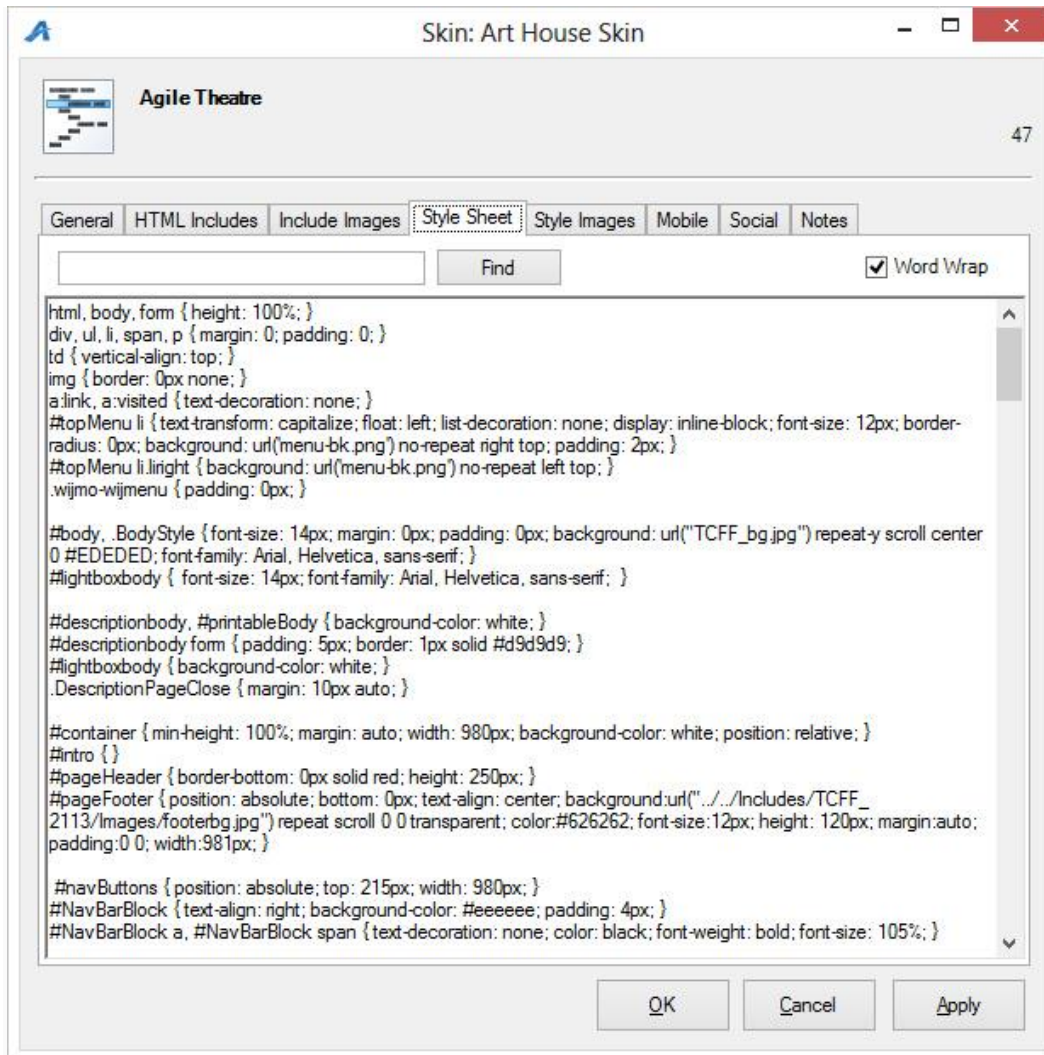

- Other files can be created with specific filenames to insert at specific locations. Contact Agile Support for help with this feature.

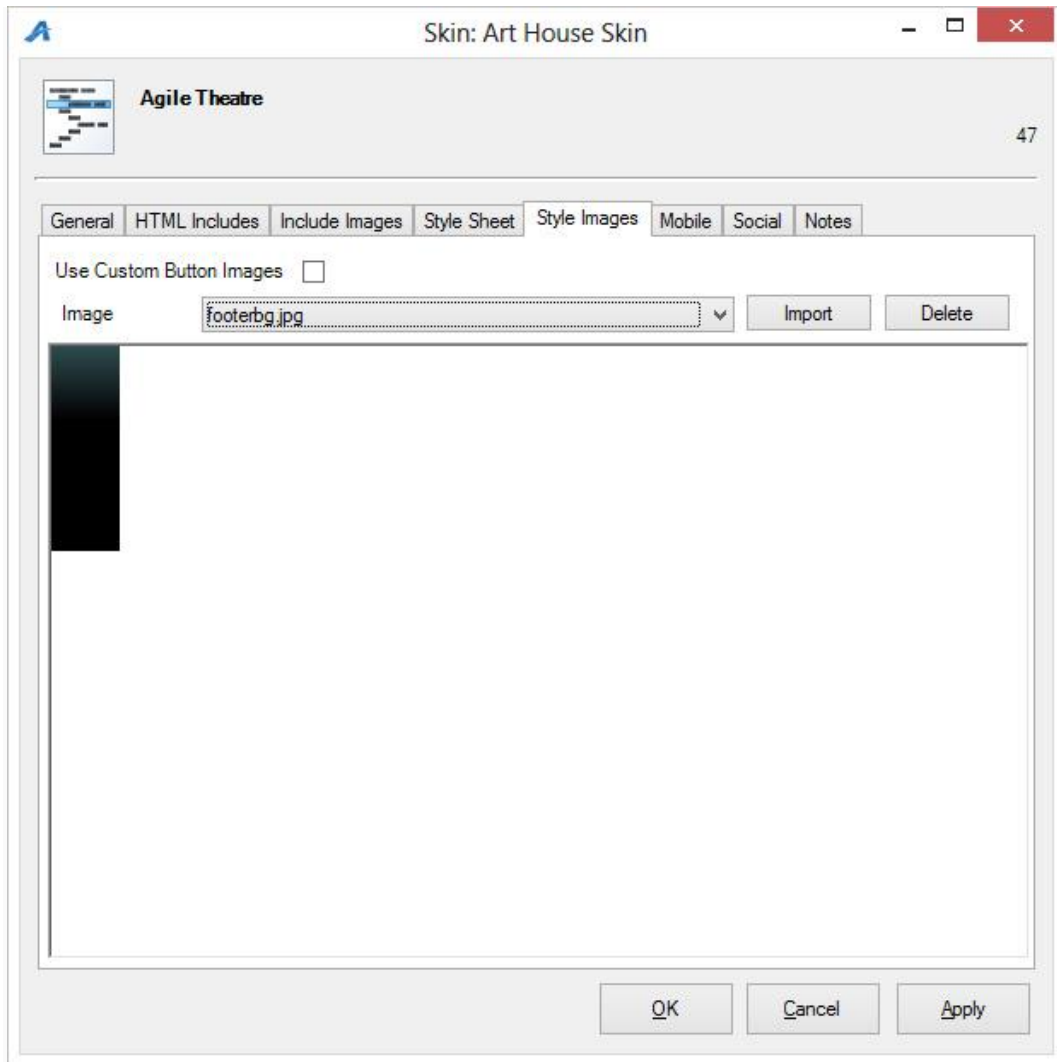

7. The **Include Images** tab is used to upload and reference images in the HTML Include files. Images can be imported and deleted. For each image the relative shortcut is provided for referencing the image.

8. The **Style Sheet** tab is used for editing the cascading style sheet for this skin. Agile defines many default styles in a master .css file. These values can be overridden in this client style sheet.

9. The **Style Images** tab is used for uploading images referenced in the style sheet. These images are placed in the same directory as the .css file.

10. The **Mobile tab** is used to set the values for the mobile style.

- The **Header Logo** is an image placed at the top of every page.
- The **Logo Link** is used to link back to a page you specify by clicking on the logo image or a Home link in the footer.
- The **JQuery UI Style** is a style framework used for popup boxes and menus. See the [jQuery ThemRoller](#) for examples of each style.
- **Color 1** is the background color for the header.
- **Color 2** is the main highlight color for text and background elements.
- **Color 3** is the secondary highlight color for text and background elements.
- The **Footer** is text included at the bottom of every page.
